Turn fragmented product evidence into governed delivery decisions

The opportunity is not merely faster PRD generation. It is a trusted path from stakeholder evidence to planning-ready work.

NeuronForge PMs and TPMs manually reconcile transcripts, briefs, notes, and clarifications before creating PRDs and delivery backlogs. The process is slow, inconsistent, and difficult to audit. PRD Orchestrator separates extraction, gap analysis, approval, document generation, validation, and sizing so automation accelerates the work without replacing human judgment.

Product-management pain point	Manual step today	Agent solution	Inputs → outputs	Primary risk → control
Fragmented requirements distributed across documents	Read every source, copy relevant statements, and manually reconcile overlaps	Drive Intake + Requirement Extractor normalize the approved source set, assign citations, and classify requirements	Transcripts, briefs, notes, clarifications → source inventory, citation ledger, requirements, constraints, stakeholders, and deadlines	Missing or stale source → controlled folder selection, file identity, current-run manifest, and hashes
Ambiguity and contradiction	Compare viewpoints, identify gaps, draft questions, and track decisions separately	Gap Analyzer detects missing information, conflicts, dependencies, and unresolved decisions	Extracted items + citations → gap register, contradiction findings, and targeted clarification questions	Model invents a resolution → explicit insufficient-information behavior, evidence references, and fail-closed clarification gate
Inconsistent PRDs	Rewrite notes into a template and manually check completeness	Human Approval + Production PRD generate a ten-section PRD only from approved scope	Approved requirements, dispositions, template → structured PRD with features, criteria, NFRs, assumptions, and open questions	Unsupported or missing content → approval boundary, template validation, reconciliation, and hallucination evaluation
Manual delivery breakdown	Create Epics, Features, User Stories, priorities, and criteria by hand	Story Breakdown creates a dynamic hierarchy while preserving source and PRD identifiers	Validated PRD + requirement IDs → Epics, Features, Stories, priorities, criteria, and mappings	Duplicate or orphaned work → stable IDs, hierarchy validation, set reconciliation, and bidirectional traceability
Weak auditability	Search source documents and reconstruct mappings after the fact	Final Validator + Traceability Controls connect evidence to every governed delivery level before export	Citations, requirements, PRD, stories, approvals → forward/reverse traceability, orphan checks, and export authorization	Incorrect or dropped mapping → deterministic equality checks, orphan detection, and controlled export
Uneven estimation readiness	Review each story, infer relative effort, and separately flag refinement needs	Post-story Sizing proposes T-shirt size, confidence, rationale, and refinement guidance	Approved stories, criteria, dependencies, NFRs → S/M/L/XL proposals and refinement list	AI estimate treated as commitment → advisory, non-blocking output with confidence disclosure and required team review

Users and value

- **PMs and TPMs:** Less reconciliation; more decision focus.
- **Engineering:** Consistent stories, criteria, priorities, and sizing context.
- **Design and stakeholders:** Preserved viewpoints and visible unresolved questions.
- **Governance reviewers:** Source-to-delivery evidence on demand.

Governing principles

- **Ground first:** Use authoritative evidence, not general knowledge.
- **Expose uncertainty:** Never silently convert ambiguity into fact.
- **Keep humans accountable:** Approval precedes production generation.
- **Validate before delivery:** Fail closed when evidence contracts do not reconcile.

Q1 conclusion: PRD Orchestrator combines automation with explicit governance. It reduces documentation effort while preserving evidence, uncertainty, stakeholder decisions, and human accountability from the first source statement through delivery-ready work.
